2. What are some of the key features of AutoCAD? Some of the key features of AutoCAD include: Geometric objects, including 2D lines, splines, polylines, arcs, elliptical arcs, circles, polycircles, ellipsoids, arcs of circles, ray, vectors, grids, and predefined shapes such as 3D solids, 2D solids, and support surfaces. Tabs and windows Measurement and plotting Rulers and angles Texting and annotation 3D modeling 3D objects 3D blocks 3D solids 3D planes 3D axes 3D rotation and navigation 3D modeling tools AutoCAD provides users with an interactive graphical user interface (GUI) through which they can edit 2D drawings and 3D models. Users can interact with AutoCAD by clicking on various objects within the viewport (display window) or by typing commands or text into a window. What are some key commands in AutoCAD? A few of the key commands are as follows: Ctrl + keypad number (counting from zero) to move up and down, Ctrl + keypad up/down to move left/right. Command to move from the default workspace to any of the workspaces Command to open the current workspace. Command to close the current workspace. Command to open the current workspace. Command to open the current workspace. Command to open the current workspace. Command to close the current workspace. Command to change the drawing size (by cropping). Command to change the drawing size (by resizing). Command to view the drawing size (as a percentage). Command to view the drawing size (as a percentage). Command to open the current axis. Command to move along the current axis. Command to rotate the current axis. Command to zoom in and zoom out. Command to move the cursor. Command to navigate to the work plane/fence/floor of the selected object. Command to display the actual or parametric coordinates of

Engine AutoCAD's in-house engines are based on the AutoCAD design tool. In the early years of AutoCAD, it used D-Cubed DHTML (discontinued in the mid-1990s), then ClarisWorks DHTML. Its current in-house system is called Liquify, which is a more lightweight DHTML (discontinued). DHTML was later replaced with GDL, which was in turn replaced by eDesigner in 2007. Although GDL and eDesigner are open source, it is not completely compatible with the open source eXtensions for AutoCAD (XA) extension for eDesigner. AutoCAD 2007 is based on a relational database which is managed through the use of data objects. As of 2012, the structure of the database is no longer used. During the transition to Web-based technology in 2013, an object-relational mapping layer was added to allow for conversion between the old database format and the new web-based format. So I have to prove that  $x^2 + y^2 = z^2$  if  $x^4 + y^4 = z^4$  What's the easiest way to prove this? A: This is equivalent to the statement: if  $a^4 + b^4 = c^4$  then  $a^2 + b^2 = c^2$ . A: Another way is: 
$$\begin{aligned} x^2 + y^2 = z^2 & \implies x^2 + y^2 = x^2 + y^2 = x^2 + y^2 = z^2 \\ & \implies x^4 + y^4 = z^4 \end{aligned}$$
 A: Another simple way:  $x^2 + y^2 = z^2$   $(x-y)(x+y) = z^2$  5b5f913d15

1. Field of the Invention The invention relates to the field of drug delivery and more particularly to the field of polymeric drug delivery systems.

2. Description of the Related Art It is known that certain agents can be encapsulated by forming the agent into a colloidal suspension, which is then hardened by addition of a hardening agent such as a polymer and/or a solvent. Hardened solids may then be formed into particles by processes such as freeze-drying, mechanical grinding, milling, etc., and used in conventional solid dosage forms such as tablets, capsules and the like. One problem that arises with known delivery systems is that they are not biodegradable. This means that the system, and the biologically active agent contained within it, will remain in the body for an undesirably long period of time. This is a significant problem because known delivery systems can interfere with normal physiological processes. For example, such interference may be due to the fact that polymeric systems containing biologically active agents must be digested by enzymes or chemically modified by the body before the biologically active agent can be released from the carrier. Even in cases where the active agent is released in a soluble form, the release may be affected by the presence of the polymeric carrier. For example, dissolution of a drug in a controlled release solid dosage form can be inhibited by a polymeric material in the dosage form. It is desirable, therefore, to provide delivery systems for biologically active agents that are biodegradable. A particularly useful method for achieving this is to form the biologically active agent into a polymeric matrix and then degrade the polymeric matrix. The degradation process causes the biologically
