The KEYMACRO command is a test driver. It is very useful in the development of applications that use cryptographic routines. KEYMACRO Screenshot: Using the MICROKEYMACRO command, the user can get basic information about the keys such as key ID, key mode, key length, key name, etc. You can also specify a path to a file containing the same information and get it from the command. Here are some examples of the keyboard input: (KEYMACRO) 1 2 3 4 c -- MICROKEYMACRO #Setting the key mode to KEYWRAP, key length to 32 bytes, and pressing the "C" key. 178969 t -- MICROKEYMACRO #Setting the key mode to MULTIKEY, key length to 512 bytes, and pressing the "T" key. 19 m -- MICROKEYMACRO #Setting the key mode to SIMPLE, key length to 256 bytes, and pressing the "M" key. m c -- MICROKEYMACRO #Setting the key mode to MULTIKEY, key length to 512 bytes, and pressing the "C" key. m KeyID: 3 KeyMode: 0x1 KeyLength: 0x1 KeyName: "Builtin Clear type" Key Name: "KeyID" Key Name: "KEY" Key Name: "KEYWRAP" Key Name: "MULTIKEY" Key Name: "SIMPLE" Key Name: "Compatible" Key Name: "USERS" Key Name: "WKST S: " t -- MICROKEYMACRO #Setting the key mode to MULTIKEY, key length to 512 bytes, and pressing the "T" key. m KeyID: 0 KeyMode: 0x2 KeyLength: 0x2 KeyName: "Simulated Key" Key Name: "KeyID" Key Name: "KEY" Key Name: "KEYWRAP" Key Name: "MULTIKEY" Key Name: "SIMPLE" Key Name: "Compatible" Key Name: "USERS" Key Name: "WKST S: " c -- MICROKEYMACRO #Setting the key mode to MULTIKEY, key length to 512 bytes, and pressing the "C" key. m KeyID: 0 KeyMode: 0x2 KeyLength: 0x2 KeyName: "Key" Key 81e310abf

1. Field of the Invention The present invention relates to a non-sintered-type magnetic core assembly and a winding used for a power generator or a power converter.
2. Description of the Related Art For a power generator such as a transformer, as is well known, a magnetic core assembly is used. When the magnetic core assembly is manufactured, it is often difficult to precisely fabricate a magnetic body. Thus, generally, a sintering technique is used for a magnetic core assembly. In addition, a winding is formed by winding a conductor around a magnetic core assembly. If the core assembly and the conductor are separately manufactured, a connecting portion of the core assembly and the conductor is easily broken. In addition, the connecting portion cannot be machined. Thus, the core assembly is mounted in the winding in advance of the winding operation. Thus, it is difficult to precisely make a predetermined surface area of the core assembly smaller than a predetermined surface area of the winding. In a magnetic core assembly, to increase a permeability of a core member, the number
