To address many issues when using Microsoft System Center 2012 and making the most of it, the App Controller monitoring pack is the tool to use. The App Controller Monitoring pack monitors and reports issues with the App Controller services and applications when any of these are unhealthy. It can also be used to detect and report on issues with the website and database on which the App Controller services are hosted. Monitoring the App Controller health with the Microsoft System Center 2012 - App Controller monitoring pack is easier than ever. You can proactively monitor the

App Controller's health, identify potential issues and trigger actions to take before the App Controller becomes unhealthy. If you want to use a localized version of the monitoring pack, you must first download and install the English version of the monitoring pack. Then, you must download and install the language pack for your respective language. With a few simple steps, you can download the App Controller monitoring pack for System Center 2012 - App Controller. You can download the language packs for the respective language that you want to use, if necessary. After you download and install the monitoring pack, you can try it for yourself to see what it's all about. If you like it, you can set it up, and begin to

use it to monitor and report on the health of App Controller. You can monitor the health of App Controller in the following ways:

- Alert on unhealthy conditions If App Controller is unhealthy, the monitoring pack will detect this and automatically send you a notification. You can choose the threshold and duration for which you want the monitoring pack to alert you on the unhealthy status of the App Controller. You can also use the data gathered by the monitoring pack to determine the root cause of the issue. Once you know the root cause, you can take corrective action to resolve the issue.
- Alert on unhealthy App Controller services The monitoring pack can alert you if the App Controller

has unresponsive services, which can be due to many reasons. This includes network errors, server issues, database issues and others. Once you know what's going wrong, you can determine the root cause of the issue, and take corrective action.

- Alert on unhealthy App Controller applications

If App Controller has unhealthy App Controller applications, the monitoring pack will also report this and alert you. You can use the information to determine the root cause of the issue, and take corrective action.

- Alert on unhealthy App Controller website and database

You can use the monitoring pack to alert you

What's New in the System Center Monitoring Pack For System Center 2012 - App Controller?

Rules to monitor and report on the availability of the App Controller services, website and database. The App Controller monitoring pack for System Center 2012 - App Controller includes the following components:

- Monitoring rules: These rules monitor the App Controller services, website and database and report on the availability of the App Controller services, website and database. These rules allow you to monitor App Controller for a given window and threshold. A rule can be run on a schedule or manually triggered.
- Context: This component includes the collection of user-defined variables that you can use in the App Controller monitoring pack to

customize the results that you see in the App Controller health. These variables can be set on the per-monitor or per-collection basis.

- Rules Designer: This component allows you to design App Controller rules and then publish them for monitoring App Controller. The Rules Designer allows you to easily create and publish App Controller rules.
- Troubleshooting: This component allows you to troubleshoot the App Controller logs on any given computer or monitor. This component includes App Controller log parsers for.csv,.txt and.log formats.
- View: This component allows you to view the App Controller health and the App Controller status reports. The View component includes a dashboard to view

the App Controller status reports and the App Controller health. - Config: This component allows you to configure the App Controller services, website and database. The Config component allows you to view and manage the values of the variables that you use to customize the App Controller monitoring pack. The App Controller config also includes health and performance rules to help monitor the App Controller service. - Reports: This component allows you to view the App Controller health, App Controller status reports and the App Controller health dashboards. The Reports component allows you to view the App Controller health, App Controller status reports and the App Controller

health dashboards. You can also export the App Controller health, App Controller status reports and the App Controller health dashboards as.csv,.txt and.log formats. Overview System Center 2012 - App Controller (SC 2012 - AC) is a component of Windows Server 2012 - based on Microsoft Azure technologies. SC 2012 - AC can be installed on-premise, in the cloud or as a cloud-only appliance and has a built-in self-hosting mechanism for use with Microsoft's Windows Azure Platform. SC 2012 - AC is designed to simplify server management in large-scale data centers. SC 2012 - AC consists of three components: App Controller, App Service Manager and Azure Monitor. SC 2012 -

AC allows administrators to monitor the health of the App Service Manager, App Controller and the website hosted by App Service Manager. SC 2012 - AC also provides insight into the metrics and logs of App Service Manager, App Controller and the website hosted by App Service Manager. SC 2012 - AC offers a built-in self-hosting mechanism that
